JBE Elevator

Configurator — Setup & Hosting Guide

This guide walks you through every step needed to publish your elevator configurator online using Git and GitHub Pages.

What you will accomplish:

- Install Git on your computer
- Create a free GitHub account and repository
- Upload your `index.html` file
- Go live with a free, permanent URL via GitHub Pages
- Register your URL in the DigiPara EAO portal

PART 1 — Install Git

Git is a free tool that tracks changes to your files and lets you publish them to GitHub.

Windows

- Go to https://git-scm.com/download/win
- Download and run the installer
- Accept all default options
- Once installed, open **Git Bash** from your Start menu

Mac

- Open **Terminal** (press Cmd+Space and search "Terminal")
- Type `git --version` and press Enter
- macOS will prompt you to install Git automatically if needed

Verify the installation works by running:

```
git --version
```

You should see something like: `git version 2.44.0`

PART 2 — Create a GitHub Account

GitHub is a free website that stores your code and hosts your webpage.

- Go to https://github.com and click **Sign up**
- Choose a username (e.g. `jbe-elevator`), enter your email and a password
- Complete the verification steps
- Choose the **Free** plan — no credit card needed

PART 3 — Create Your Repository

A repository ("repo") is a folder on GitHub that holds your project files.

- Click the **+** icon in the top-right corner of GitHub
- Select **New repository**
- Repository name: `elevator-configurator`
- Visibility: select **Public** (required for free hosting)
- Leave everything else as default and click **Create repository**

Keep the GitHub page open — you will need it in the next step.

PART 4 — Upload Your File Using Git

Step 1 — Configure Git with your identity

Open Git Bash (Windows) or Terminal (Mac) and run:

```
git config --global user.name "Your Name"
git config --global user.email "your@email.com"
```

Step 2 — Navigate to your project folder

Your `index.html` file should be in a folder on your computer. Navigate there:

```
cd ~/Desktop
```

Replace `~/Desktop` with the actual path to your folder if it is stored elsewhere.

Step 3 — Initialise a Git repository

```
git init
```

Step 4 — Add your file

```
git add index.html
```

Step 5 — Save a snapshot (commit)

```
git commit -m "Initial upload: elevator configurator page"
```

Step 6 — Connect to GitHub

On your GitHub repository page, copy the URL that ends in `.git`, then run:

```
git remote add origin https://github.com/YOUR-USERNAME/elevator-configurator.git
git branch -M main
git push -u origin main
```

Replace YOUR-USERNAME with your actual GitHub username.

Step 7 — Personal Access Token (if Git asks for a password)

GitHub no longer accepts your account password in the terminal. You need a token instead:

- Go to https://github.com/settings/tokens

- Click **Generate new token (classic)**
- Give it a name like "my laptop", set expiration to **No expiration**
- Check the box next to **repo**
- Click **Generate token** and copy it
- Use this token as your password when Git prompts you

PART 5 — Enable GitHub Pages (Free Hosting)

GitHub Pages turns your repository into a live website — for free, permanently.

- Go to your repository: `https://github.com/YOUR-USERNAME/elevator-configurator`
- Click the **Settings** tab
- In the left sidebar, click **Pages**
- Under **Source**, select **Deploy from a branch**
- Under **Branch**, select **main** and folder **/ (root)**
- Click **Save**
- Wait 1–2 minutes, then refresh the page

Your permanent live URL will appear at the top of the page:

```
https://YOUR-USERNAME.github.io/elevator-configurator/
```

This URL never expires and requires no renewal.

PART 6 — Register Your URL in the EAO Portal

DigiPara's server only loads the configurator for approved domains. You must add your new URL.

- Log in to https://app.elevatorarchitect.com
- Go to **User menu** → **Contract Settings**
- Find your White Label Instance and click **Edit**
- Scroll to **Allowed Web Site Origins**
- Click **Add allowed Web Site Origin**
- Enter: `https://YOUR-USERNAME.github.io`
- Click **Save**

Visit your live page — the configurator should now load correctly.

PART 7 — How to Update Your Page in the Future

Whenever you make changes to `index.html`, run these 3 commands from your project folder:

```
git add index.html
git commit -m "Describe what you changed"
git push
```

Your live site updates automatically within about 1–2 minutes.

Quick Reference

What	Where / Value
Your GitHub repo	https://github.com/YOUR-USERNAME/elevator-configurator
Your live site	https://YOUR-USERNAME.github.io/elevator-configurator/
EAO portal	https://app.elevatorarchitect.com

Instance ID	a25QF000008XH3tYAG
DigiPara support	sales@digipara.com

Troubleshooting

Configurator shows blank / does not load
Check that your GitHub Pages URL is added to EAO Allowed Web Site Origins.

Git asks for a password and rejects it
Use a Personal Access Token instead — see Part 4, Step 7.

GitHub Pages URL not appearing after saving
Wait 2 minutes and refresh the Settings → Pages page.

Changes not showing on the live site
Run `git add index.html`, `git commit -m "update"`, `git push` and wait 1–2 minutes.
